

CI denotes the central 95% distribution of arrival ages, not a CI of the mean. Extant−lineage paths only.

KDE bounded by the tree and model temporal limits. Blue: empirical 2.5th−97.5th age percentiles; summaries use unsmoothed ages
CI describes arrival−age uncertainty, not uncertainty in the mean; conditional on a matching event.

CI denotes the central 95% distribution of arrival ages, not a CI of the mean. Extant−lineage paths only.
